

Group: Together4Ever

Date and time: 2018-09-07 12.00

Participants: Alexander Solberg, Spondon Siddiqui, Tobias Lindroth, Viktor Franzén

#Objectives

Figure out details about our chat application

#Reports

We have gained knowledge about Gradle and Git

#Discussion Items

- Should our chat application be more like IRC or Slack/Discord (save messages or not)?
- We should decide what the primary goal is, and plan possible extensions.
- Determine what kind of roles we should use
- Who should get what role
- Determine what each person's core responsibility is within their role
- What is our target audience

Outcomes and assignments

The consensus is that the application should save messages. However, perhaps we can develop a version of the app that doesn't save the messages and then extend it afterwards.

Possible extensions

- images
- text files
- sound files
- emojis
- private/public groups (password protected)
- customizability

The roles we have decided upon are

- Alex: Database Responsible
- Viktor: Software Developer
- Tobias: Software Developer
- Spondon: UI developer

These roles will involve:

- Database Responsible: Create a database and connect to the application
- Software developer: Develop code using design principles/ patterns. Unit testing
- UI Developer: Design and test the User Interface, make sure everything works as it should.

Our target audience is young adults

Until next time, think on user stories, sketch a GUI, think about how to design the model and gain knowledge about databases.

Wrap up

Next meeting will be held 10/9/2018 15.00
